

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

## 98. Proposed by WALTER H. DRANE, Graduate Student, Harvard University, Cambridge, Mass.

A spool, with light thread wound around, is placed upon a rough table so that the thread will emerge from beneath the spool. The thread is passed over a smooth pulley at end of table and a weight attached, the pulley being so adjusted that thread is parallel to surface of table. If friction between spool and table is sufficient to prevent slipping, determine motion of spool and weight. [From problems in Mechanica at Harvard University.]

I. Solution by WILLIAM HOOVER, A. M., Ph. D., Professor of Mathematics and Astronomy, Ohio University, Athens, O.

Let  $x$  and  $y$  be the horizontal and vertical parts of the string at any time  $t$  from the beginning of the motion,  $m$  the mass of the spool only,  $m'$  the mass attached to the thread,  $\phi$  the angle of rotation of the spool in the time  $t$ ,  $a$  and  $k$  the radius and radius of gyration of the spool, respectively,  $g$  the acceleration of gravity,  $T$  the tension in the thread, and  $F$  the friction.

The equation of motion of  $m'$  is  $m' \frac{d^2y}{dt^2} = m'g - T$ . . .(1).

For the linear and rotary motions of the spool,

$$m \frac{d^2x}{dt^2} = T - F \quad \dots(2), \quad mk^2 \frac{d^2\phi}{dt^2} = -Ta + Fa \quad \dots(3).$$

Now  $dx = ad\phi$ . . .(4), and  $b$  being the initial length of free string,  $x + y = b + a\phi$ . . .(5).

From (4),  $\frac{d^2\phi}{dt^2} = \frac{1}{a} \frac{d^2x}{dt^2}$  . . .(6), and (3) is  $mk^2 \frac{d^2x}{dt^2} = -Ta^2 + Fa^2$  . . .(7).

From (2),  $ma^2 \frac{d^2x}{dt^2} = Ta^2 - Fa^2$  . . .(8).

(7) and (8) give  $m(a^2 + k^2) \frac{d^2x}{dt^2} = 0$ . . .(9), and  $T = F$ . . .(10).

From (5),  $\frac{d^2x}{dt^2} + \frac{d^2y}{dt^2} = a \frac{d^2\phi}{dt^2}$  . . .(11), which with (6) gives  $\frac{d^2y}{dt^2} = 0$ . . .(12).

(9) gives  $\frac{d^2x}{dt^2} = 0$ . . .(13), and (6) then gives  $\frac{d^2\phi}{dt^2} = 0$ . . .(14).

Hence, since the system starts from rest, the last three equations show that there is no motion afterwards.
